Basics of Supply Chain Management

The basic concepts in managing the complete flow of materials in a supply chain from suppliers to customers are covered in the Basics module. This module covers manufacturing, distribution, service, and retail industries. This includes the fundamental relationships in the design, planning, execution, monitoring, and control that occur. Knowledge of the material in this module is assumed as a prerequisite for the other APICS CPIM modules, which cover similar topics in much greater depth.

Topics include:

- Understanding basic businesswide concepts, including understanding various supply chain environments
- Managing demand, including markets and customer expectations
- Designing products, processes, and information systems
- Understanding supply issues including inventory costs, functions, and metrics

The Basics of Supply Chain Management module is one of five modules in the APICS Certified in Production and Inventory Management (CPIM) certification program. Certification requires successful completion of each module exam. Exams are administered separately by Pearson Vue testing centers.
